Red-Black Tree

M.Sc. Franci Suni Lopez

Universidad Nacional de San Agustín de Arequipa

M.S. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

1

Red-Black Trees

- “Balanced” binary search trees guarantee an $O(\lg n)$ running time
- Red-black-tree
 - Binary search tree with an additional attribute for its nodes: **color** which can be **red** or **black**
 - Constrains the way nodes can be colored on any path from the root to a leaf:

Ensures that no path is more than twice as long as any other path \Rightarrow the tree is balanced

M.S. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

2

Red-Black Trees

- Rudolf Bayer – 1972 – Symmetric Binary Tree.
- Leonidas Guibas, Robert Sedgwick – 1978 – A Dichromatic Framework for Balanced Trees

M.Sc. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

3

Example: RED-BLACK-TREE

- For convenience we use a sentinel **NIL[T]** to represent all the **NIL** nodes at the leafs
 - **NIL[T]** has the same fields as an ordinary node
 - **Color[NIL[T]] = BLACK**
 - The other fields may be set to arbitrary values

M.Sc. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

4

Any difference with AVL?

M.Sc. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

5

Red-Black-Trees Properties

(**Satisfy the binary search tree property**)

1. Every **node** is either **red** or **black**
2. The **root** is **black**
3. Every **leaf (NIL)** is **black**
4. If a node is **red**, then both its children are **black**
 - No two consecutive red nodes on a simple path from the root to a leaf
5. For each node, all paths from that node to descendant leaves contain the same number of black nodes

M.Sc. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

6

Black-Height of a Node

- **Height of a node:** the number of edges in the **longest** path to a leaf
- **Black-height of a node x :** $bh(x)$ is the number of black nodes (including NIL) on the path from x to a leaf, not counting x

Most important property of Red-Black-Trees

A red-black tree with n internal nodes
has height at most $2\lg(n + 1)$

- Need to prove two claims first ...

Operations on Red-Black-Trees

- The non-modifying binary-search-tree operations **MINIMUM**, **MAXIMUM**, **SUCCESSOR**, **PREDECESSOR**, and **SEARCH** run in $O(h)$ time
 - They take $O(\lg n)$ time on red-black trees
- What about **TREE-INSERT** and **TREE-DELETE**?
 - They will still run on $O(\lg n)$
 - We have to guarantee that the modified tree will still be a red-black tree

M.Sc. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

15

INSERT

INSERT: what color to make the new node?

- Red? Let's insert 35!
 - Property 4 is violated: if a node is red, then both its children are black
- Black? Let's insert 14!
 - Property 5 is violated: all paths from a node to its leaves contain the same number of black nodes

M.Sc. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

16

DELETE

DELETE: what color was the node that was removed? **Black?**

1. Every **node** is either **red** or black **OK!**

2. The **root** is black

Not OK! If removing the root and the child that replaces it is **red**

3. Every **leaf** (NIL) is black **OK!**

4. If a node is red, then both its children are black

Not OK! Could create two red nodes in a row

Not OK! Could change the black heights of some nodes

5. For each node, all paths from the node to descendant leaves contain the same number of black nodes

Rotations

- Operations for re-structuring the tree after insert and delete operations on red-black trees
- Rotations take a red-black-tree and a node within the tree and:
 - Together with some node re-coloring they help restore the red-black-tree property
 - Change some of the pointer structure
 - **Do not** change the binary-search tree property
- Two types of rotations:
 - Left & right rotations

Left Rotations

- Assumptions for a left rotation on a node x :
 - The right child of x (y) is not NIL

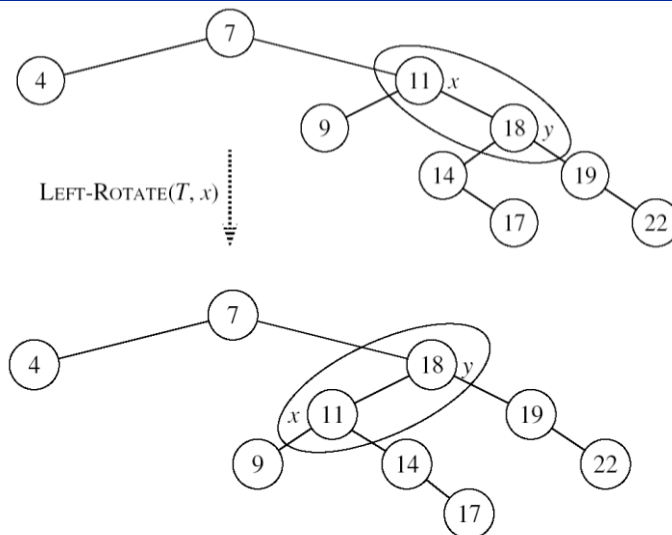

- Idea:
 - Pivots around the link from x to y
 - Makes y the new root of the subtree
 - x becomes y 's left child
 - y 's left child becomes x 's right child

M.Sc. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

19

Example: LEFT-ROTATE

M.Sc. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

20

LEFT-ROTATE(T, x)

1. $y \leftarrow \text{right}[x]$ ► Set y
2. $\text{right}[x] \leftarrow \text{left}[y]$ ► y 's left subtree becomes x 's right subtree
3. if $\text{left}[y] \neq \text{NIL}$
4. then $p[\text{left}[y]] \leftarrow x$ ► Set the parent relation from $\text{left}[y]$ to x
5. $p[y] \leftarrow p[x]$ ► The parent of x becomes the parent of y
6. if $p[x] = \text{NIL}$
7. then $\text{root}[T] \leftarrow y$
8. else if $x = \text{left}[p[x]]$
9. then $\text{left}[p[x]] \leftarrow y$
10. else $\text{right}[p[x]] \leftarrow y$
11. $\text{left}[y] \leftarrow x$ ► Put x on y 's left
12. $p[x] \leftarrow y$ ► y becomes x 's parent

M.Sc. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

21

Right Rotations

- Assumptions for a right rotation on a node x :
 - The left child of y (x) is not NIL

- Idea:
 - Pivots around the link from y to x
 - Makes x the new root of the subtree
 - y becomes x 's right child
 - x 's right child becomes y 's left child

M.Sc. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

22

Insertion

- Goal:
 - Insert a new node z into a red-black-tree
- Idea:
 - Insert node z into the tree as for an ordinary binary search tree
 - Color the node **red**
 - Restore the red-black-tree properties
 - Use an auxiliary procedure RB-INSERT-FIXUP

M.Sc. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

23

RB Properties Affected by Insert

1. Every **node** is either **red** or **black** OK!
2. The **root** is black If z is the root
 \Rightarrow **not OK**
3. Every **leaf** (NIL) is **black** OK!
4. If a node is red, then both its children are black If $p(z)$ is red \Rightarrow **not OK**
 z and $p(z)$ are both red
5. For each node, all paths from the node to descendant leaves contain the same number of black nodes OK!

M.Sc. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

24

RB-INSERT-FIXUP – Case 1

z's "uncle" (y) is **red**

Idea: (z is a right child)

- $p[p[z]]$ (z's grandparent) must be black: z and $p[z]$ are both red

• Color $p[z]$ **black**

• Color y **black**

• Color $p[p[z]]$ **red**

• $z = p[p[z]]$

- Push the "**red**" violation up the tree

25

RB-INSERT-FIXUP – Case 1

z's "uncle" (y) is **red**

Idea: (z is a left child)

- $p[p[z]]$ (z's grandparent) must be black: z and $p[z]$ are both red

• color $p[z] \leftarrow$ **black**

• color y \leftarrow **black**

• color $p[p[z]] \leftarrow$ **red**

• $z = p[p[z]]$

- Push the "**red**" violation up the tree

26

RB-INSERT-FIXUP – Case 3

Case 3:

- z's "uncle" (y) is **black**
- z is a left child

Idea:

- $\text{color } p[z] \leftarrow \text{black}$
- $\text{color } p[p[z]] \leftarrow \text{red}$
- $\text{RIGHT-ROTATE}(T, p[p[z]])$
- No longer have 2 reds in a row
- $p[z]$ is now black

27

RB-INSERT-FIXUP – Case 2

Case 2:

- z's "uncle" (y) is **black**
- z is a right child

Idea:

- $z \leftarrow p[z]$
- $\text{LEFT-ROTATE}(T, z)$

\Rightarrow now z is a left child, and both z and $p[z]$ are red \Rightarrow case 3

28

Example

M.Sc. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

30

Analysis of RB-INSERT

- Inserting the new element into the tree $O(\lg n)$
- RB-INSERT-FIXUP
 - The while loop repeats only if CASE 1 is executed
 - The number of times the while loop can be executed is $O(\lg n)$
- Total running time of RB-INSERT: $O(\lg n)$

M.Sc. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

33

Red-Black Trees - Summary

- Operations on red-black-trees:
 - SEARCH $O(h)$
 - PREDECESSOR $O(h)$
 - SUCCESSOR $O(h)$
 - MINIMUM $O(h)$
 - MAXIMUM $O(h)$
 - INSERT $O(h)$
 - DELETE $O(h)$
- Red-black-trees guarantee that the height of the tree will be $O(\lg n)$

M.Sc. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

34

AVL vs Red-Black

	AVL	Red-Black
- data		
Search	Faster, lower height	
Insert		Faster, in average less rotations
Remove		Faster, in average less rotations
+ data		
Search	Faster, lower height	
Insert	Faster, problems with the search	
Remove	Faster, in average less rotations	Faster than AVL in the worst case

M.Sc. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

35

Homework

- Segment Tree.
- Interval Tree.
- 3 points in class participation.
- Problems or limitations with balanced trees -> AVL and Red-Black

M.Sc. Franci Suni Lopez - UNSA

fsunilo@unsa.edu.pe

36
